### Introduction to Deep Learning (IN 2346)

Prof. Dr. Angela Dai

## **Exercise 2: Math Background**

#### Exercise 1.1

**Notation.** We use the following notations in this exercise:

- Scalars are denoted with lowercase letters. E.g.  $x, \phi$
- Vectors are denoted with bold lowercase letters. E.g.  $x, \phi$
- Matrices are denoted with bold uppercase letters. E.g.  $X, \Sigma$
- a) Let  $\boldsymbol{x} \in \mathbb{R}^M, \boldsymbol{y} \in \mathbb{R}^N$ , function  $f : \mathbb{R}^M \times \mathbb{R}^N \to \mathbb{R}$ ,  $f(\boldsymbol{x}, \boldsymbol{y}) = \boldsymbol{x}^\top A \boldsymbol{y} + \boldsymbol{x}^\top B \boldsymbol{x} C \boldsymbol{y} + \boldsymbol{D}$ . Compute the dimensions of the matrices  $\boldsymbol{A}, \boldsymbol{B}, \boldsymbol{C}, \boldsymbol{D}$  for the function so that the mathematical expression is valid.
- b) Let  $\boldsymbol{x} \in \mathbb{R}^N$ ,  $\boldsymbol{M} \in \mathbb{R}^{N \times N}$ . Express the function  $f(\boldsymbol{x}) = \sum_{i=1}^N \sum_{j=1}^N x_i x_j M_{ij}$  using only matrix-vector multiplications.
- c) Suppose  $u, v \in V$ , where V is a vector space. ||u|| = ||v|| = 1 and  $\langle u, v \rangle = 1$ . Prove that u = v.

#### Exercise 1.2

In this exercise we want to determine the gradients for a few simple functions, which will be helpful for the upcoming lectures.

- a) For  $x \in \mathbb{R}^n$ , let  $f : \mathbb{R}^n \to \mathbb{R}$  with  $f(x) = b^{\top}x$  for some known vector  $b \in \mathbb{R}^n$ . Determine the gradient of the function f. Hint: Use that  $f(x) = b^{\top}x = \sum_{i=1}^n b_i x_i$ .
- b) Now consider the quadratic function  $f: \mathbb{R}^n \to \mathbb{R}$  with  $f(x) = x^\top Ax$  for a symmetric matrix  $A \in \mathbb{S}_n$ . Determine the gradient of the function f. Hint: A symmetric matrix  $A \in \mathbb{S}_n$  satisfies that  $A_{ij} = A_{ji}$  for all  $1 \le i, j \le n$ .
- c) Now let us go a step further and let us determine the derivative of the following function  $f: \mathbb{R}^n \to \mathbb{R}$  with

$$f(x) = ||Ax - b||_2^2 = (Ax - b)^{\top} (Ax - b)$$

where  $A \in \mathbb{R}^{m \times n}$  and  $b \in \mathbb{R}^m$ .

#### Exercise 1.3

- a) Compute the derivatives for the following functions:  $f_i: \mathbb{R} \to \mathbb{R}, i \in \{1, 2, 3\}$ 
  - $f_1: f_1(x) = (x^3 + x + 1)^2$
  - $f_2: f_2(x) = \frac{e^{2x}-1}{e^{2x}+1}$
  - $f_3: f_3(x) = (1-x)\log(1-x)$

- b) For a function  $f: \mathbb{R}^n \to \mathbb{R}$ , the gradient is defined as  $\nabla f = (\frac{\partial f}{\partial x_1}, \dots, \frac{\partial f}{\partial x_n})$ . Calculate the gradients of the following functions:  $f_i: \mathbb{R}^2 \to \mathbb{R}, i \in \{4, 5\}$ 
  - $f_4: f_4(\boldsymbol{x}) = \frac{1}{2}||\boldsymbol{x}||_2^2$
  - $f_5: f_5(\boldsymbol{x}) = \frac{1}{2}||\boldsymbol{x}||_2$
- c) For a function  $f: \mathbb{R}^n \to \mathbb{R}^m$ , the Jacobian is defined as

$$\mathbb{J} = \begin{bmatrix}
\frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} & \cdots & \frac{\partial f_1}{\partial x_n} \\
\frac{\partial f_2}{\partial x_1} & \frac{\partial f_2}{\partial x_2} & \cdots & \frac{\partial f_2}{\partial x_n} \\
\vdots & \vdots & \ddots & \vdots \\
\frac{\partial f_m}{\partial x_1} & \frac{\partial f_m}{\partial x_2} & \cdots & \frac{\partial f_m}{\partial x_n}
\end{bmatrix}$$

Calculate the Jacobian matrix of the following functions:  $f_i : \mathbb{R}^n \to \mathbb{R}^m$ ,  $i \in \{6,7\}$ 

- $f_6: \mathbb{R} \times \mathbb{R} \to \mathbb{R}^2, f_6(r, \varphi) = (r \cos \varphi, r \sin \varphi)^\top$
- $f_7: \mathbb{R} \to \mathbb{R}^2, f_7(t) = (r\cos t, r\sin t)^{\top}$
- d) For a function  $f: \mathbb{R}^n \to \mathbb{R}^n$  the divergence is defined as  $\operatorname{div} f = \sum_{i=1}^N \frac{\partial f_i}{\partial x_i}$ . Calculate the divergence for the following functions:  $f_i: \mathbb{R}^n \to \mathbb{R}^n$ ,  $i \in \{8, 9\}$ 
  - $f_8: \mathbb{R}^2 \to \mathbb{R}^2, f_8(x,y) = (-y,x)^{\top}$
  - $f_9: \mathbb{R}^2 \to \mathbb{R}^2, f_9(x,y) = (x,y)^{\top}$

#### Exercise 1.4

In this exercise, we want to take a look at the softmax function which is a common activation function in neural networks in order to normalize the output of a network to a probability distribution over predicted output classes. We will discuss the softmax function later in this lecture in more detail.

The softmax function  $\sigma: \mathbb{R}^n \to \mathbb{R}^n$  is defined by

$$\sigma(z)_i = \frac{e^{z_i}}{\sum_{j=1}^n e^{z_j}}$$

for  $1 \le i \le n$  and  $z = \begin{pmatrix} z_1 & z_2 & \dots & z_n \end{pmatrix} \top$ . In the expanded form, we write:

$$\hat{y} = \sigma(z_1, z_2, \dots z_n) = \left[ \frac{e^{z_1}}{\sum_{k=1}^n e^{z_k}}, \frac{e^{z_2}}{\sum_{k=1}^n e^{z_k}}, \dots, \frac{e^{z_n}}{\sum_{k=1}^n e^{z_k}} \right].$$

Determine the derivative of the softmax function.

Hint: Deriving  $\sigma(z)$  with respect to z will lead to  $n \times n$  partial derivatives, i.e.  $\frac{\partial \sigma(z)_i}{\partial z_j}$  for  $1 \le i, j \le n$ . It is important to consider the two cases (1) i = j and (2)  $i \ne j$ .

#### Exercise 1.5

#### a) Variance

We say that two random variables X, Y are independent if and only if the joint cumulative distribution function  $F_{X,Y}(x,y)$  satisfies  $F_{X,Y}(x,y) = F_X(x)F_Y(y)$ . In the case of independence, the following property holds for these variables: Let f, g be two real-valued functions defined on the codomains of X, Y, respectively. Then  $\mathbb{E}[g(X)h(Y)] = \mathbb{E}[g(X)] \cdot \mathbb{E}[h(Y)]$ .

Assume that X, Y are two random variables that are independent and identical distributed (i.i.d.) with  $X, Y \sim \mathcal{N}(0, \sigma^2)$ . Prove that

$$\operatorname{Var}(XY) = \operatorname{Var}(X)\operatorname{Var}(Y).$$

Remember this property as it will play an important role at a later point of the lecture, when we take a look at the initialization of the weights of a neural network (Xavier initialization).

#### b) Normal distribution

Remark: The family of random variables that are normally distributed is closed under linear transformation, that means if X is normally distributed, then for every  $a, b \in \mathbb{R}$  the random variable aX + b is normally distributed.

For this exercise, assume that the random variable X is normally distributed with mean  $\mu$  and variance  $\sigma^2$ , i.e.  $X \sim \mathcal{N}(\mu, \sigma^2)$ . Let  $Z = \frac{X - \mu}{\sigma}$ . From the remark, we know that Z is again normally distributed. Determine the mean and the variance of the random variable Z.
